BUSINESS MODEL CANVAS

Sustainable Mango Farm

Sustainable mango cultivation and natural drying to add value and reduce post-harvest losses

1. Project understanding

The project objective is to grow mangoes sustainably and transform part of the harvest into naturally dried mangoes, adding value and reducing post-harvest loss. The business model therefore combines fresh mango sales with value addition through dried mango production.

The project overview identifies nine operational areas: plants, water supply, product transformation, crop storage, energy supply, visitor management, fencing and security, machinery, and sales and marketing. This proposal connects those areas to customers, value propositions, revenues, partners, and costs. It does not assume that the farm already has confirmed buyers, certifications, or a specific production capacity.

2. Proposed Business Model Canvas

This is a first proposal for brainstorming. Commercial details not specified in the project description are marked as points to validate.

BMC BLOCK	PROPOSED CONTENT
1. Customer Segments	• Households and consumers buying fresh mangoes • Fruit sellers, market traders, and local retailers • Shops and food businesses that may stock dried mangoes • Potential bulk buyers, depending on production capacity **To validate:** *Start with reachable local customers and retailers; validate demand before committing to larger or export markets.*
2. Value Propositions	• Fresh mangoes grown with attention to sustainable farming and responsible resource use • Naturally dried mangoes that preserve part of the seasonal harvest • Lower post-harvest losses by processing suitable fruit before it spoils • Local value addition through a product with a longer shelf life **To validate:** *Food safety, quality, shelf life, and the drying method must be established and consistently maintained.*
3. Channels	• Direct sales at the farm or local markets • Supply to fruit sellers, shops, and retailers • Direct orders through community networks • Social media and messaging platforms for promotion and orders **To validate:** *Choose channels that match production volume, packaging capacity, transport, and customer access.*
4. Customer Relationships	• Direct and friendly customer service • Clear information about product origin and storage • Reliable quality and delivery for retailer relationships • Sampling and feedback to improve taste, texture, and packaging **To validate:** *Start with simple relationship-building methods the team can maintain.*
5. Revenue Streams	• Sales of fresh mangoes • Sales of naturally dried mangoes in suitable pack sizes • Potential bulk sales to retailers or food businesses • Potential farm visits or educational activities if included in the operating plan

	To validate: *Prices, pack sizes, sales volumes, and dried-product yield need to be calculated. Farm visits are only a possible secondary stream.*
6. Key Resources	• Land, mango trees, and healthy planting material • Water supply and soil-management practices • Harvesting, sorting, storage, and drying equipment • Energy supply and machinery • Labour and agricultural/food-processing know-how • Packaging and customer relationships **To validate:** *Check actual availability and capacity of land, water, equipment, and labour.*
7. Key Activities	• Sustainable cultivation and orchard care • Water management and harvesting • Sorting and safe storage of harvested fruit • Allocating fruit to fresh sales or drying • Hygienic drying, packaging, and storage • Equipment maintenance and site security • Marketing, sales, and customer feedback **To validate:** *Track quantities harvested, sold fresh, sent for drying, lost, and converted into finished dried mango.*
8. Key Partnerships	• Agricultural input and seedling suppliers • Growers who could supplement supply if needed • Equipment, repair, and packaging suppliers • Retailers, market traders, and potential bulk buyers • Agricultural extension, food-safety, or training organizations **To validate:** *These are prospective partner categories, not confirmed partnerships.*
9. Cost Structure	• Land preparation, seedlings, orchard care, and agricultural inputs • Water supply and irrigation • Labour for farming, harvesting, sorting, and drying • Drying energy, equipment, repairs, and maintenance • Storage, hygiene, packaging, and labelling • Transport, marketing, and sales **To validate:** *Compare the cost and revenue of fresh sales with the added costs and yield of dried mango production.*

3. Initial brainstorming proposal

A practical starting model is to sell fresh mangoes when they can be marketed promptly and dry a portion of the harvest when feasible and economically worthwhile. This creates two complementary revenue streams and gives the project a clear reason to invest in storage, energy, and transformation.

- **Use a two-product model.** Sell fresh mangoes when market conditions and fruit quality favour immediate sale; dry selected fruit when appropriate.
- **Measure post-harvest losses.** Record harvest volume, fresh sales, fruit sent for drying, losses, and finished dried-product yield.
- **Manage resources as business costs.** Water, energy, storage, and machinery affect both sustainability and profitability.
- **Test demand before scaling.** Use a small batch to test quality, pack sizes, customer interest, prices, and retailer margins.

4. Questions for the team discussion

1. How much mango can the farm realistically harvest, and what proportion could be dried?
2. Which drying method and energy source will be used, and what are their capacity and costs?

3. Who are the first realistic customers for fresh and dried mangoes?
4. What packaging, food-safety, storage, and shelf-life requirements must be met?
5. What are the costs per kilogram for fresh sales and dried production, including processing yield and labour?
6. Which sales channels can the team reach first, and how will demand be tested?

5. Assumptions to validate

The project objective and nine operational areas are taken from the supplied project overview. Customer priority, prices, pack sizes, production volumes, drying economics, farm visits, and specific suppliers or buyers remain proposals for discussion. This draft does not assume that certifications, export access, or customer commitments are already in place.

Context for the opportunity

Mango drying is an established value-addition activity in Burkina Faso, and sector sources describe post-harvest losses, energy costs, and product quality as important practical challenges. These factors make loss reduction, safe processing, and careful cost calculation relevant topics for the team to assess.
