

EXCELLENCE PROGRAM 2026

BIT x Infineon

Christelle DEHOUMON

July 24th, 2026

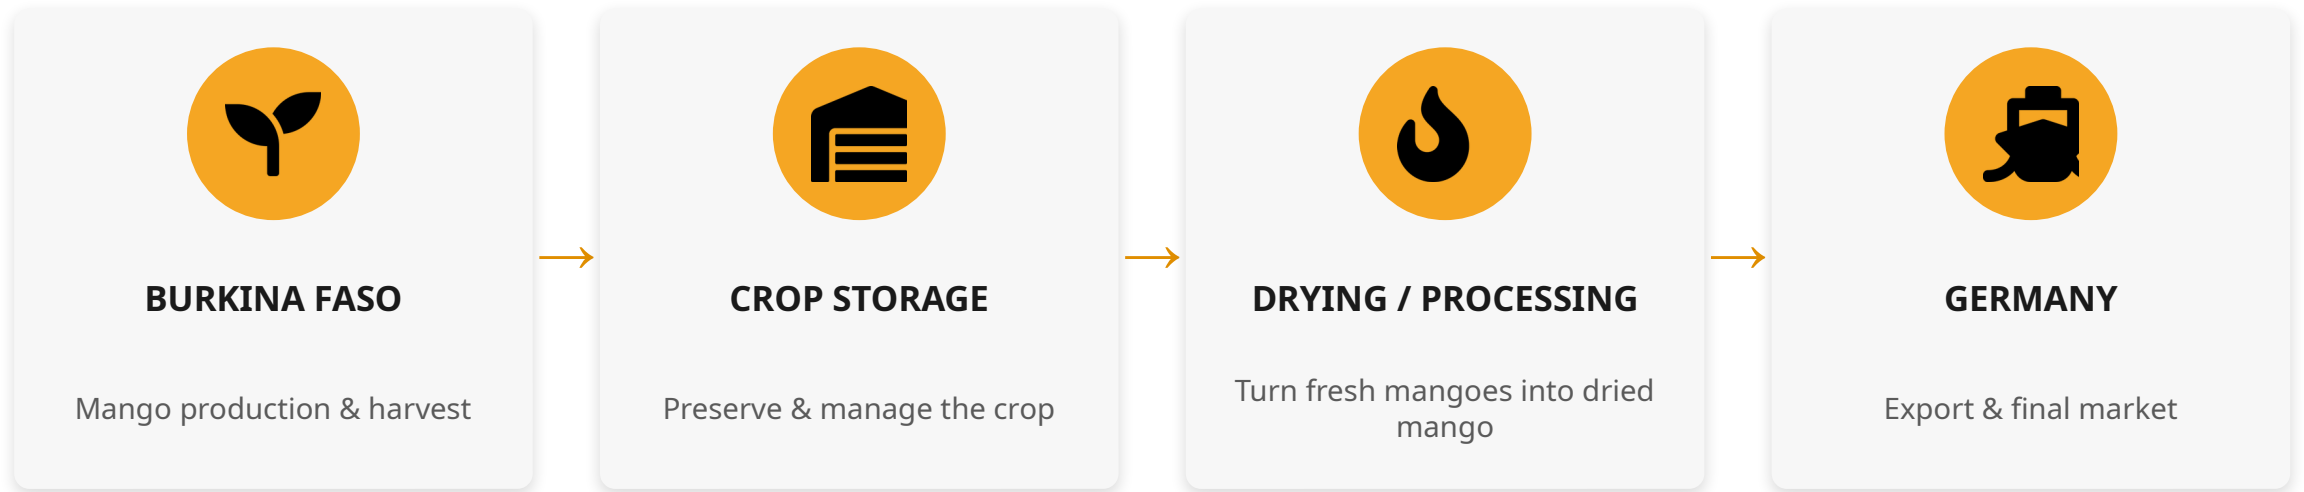

DIGI MANGO

Project Digitalization • Farm • Exportation

1. Understanding the Big Picture

My understanding of the Excellence Program 2026 project

WHAT I UNDERSTOOD

The project is about building a sustainable and traceable value chain: starting with mango production in Burkina Faso, managing the crop properly, transforming it into dried mango, and finally supporting its journey to the German market.

2. Understanding My Role: Crop Storage

I see Crop Storage as the control point between harvest and processing.

THE STORAGE STAGE

The place where harvested mangoes are received, monitored and prepared for the next step.

Inventory

What do we have? How much? Where?

Conditions

Are temperature and humidity acceptable?

FIFO

Which batch should leave first?

Loss & Waste

How much are we losing, and why?

Capacity

Do we have enough space for what is coming?

My goal: make storage more visible, traceable and manageable.

3. My First Ideas: Turning Problems into a Digital Solution

My first proposal is a simple Crop Storage Management system built around batches.

A batch journey

- 1 Batch enters storage**
ID • quantity • date • location
- 2 Inventory is updated**
Current quantity • status
- 3 Conditions are monitored**
Temperature • humidity
- 4 FIFO helps prioritize**
Oldest batch first
- 5 Losses are recorded**
Quantity • reason
- 6 Capacity is tracked**
Used • available space

CROP STORAGE DASHBOARD

A first interface idea: stock, conditions, alerts and capacity at a glance.

Key data I would start with

Batch ID • Quantity • Entry date • Storage location
Temperature • Humidity • Loss quantity • Loss reason
Capacity used • Capacity available • Processing status

4. What I Learned from Last Year's Work

The previous work gave me a starting point instead of making me start from zero.

LAST YEAR'S FOUNDATION

Mango storage • smart drying • inventory management • Solar IoT • process mapping

What this changed in my thinking

I understood that storage should not be isolated. It needs to connect clearly with drying / processing and should build on the existing inventory and smart-technology ideas.

What I want to update in 2026

Move from individual ideas toward one integrated Crop Storage module: batch traceability, monitoring, FIFO, loss tracking and capacity planning.

BUILD ON

- Inventory management
- Mango storage
- Smart drying
- Solar / IoT direction

EXPAND

- Batch tracking
- Storage monitoring
- FIFO management
- Loss & capacity insights

5. What I Will Do Next Week

The goal is to move from a first concept to something the team can review and improve.

01

REVIEW

Study last year's storage, drying and inventory work more deeply.

02

DEFINE

Finalize the features and exact data points needed.

03

DESIGN

Create the first workflow and dashboard mockup.

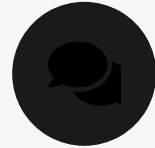

04

CONNECT

Map links with Harvest, Processing and other modules.

05

DISCUSS

Present the concept, collect feedback and iterate.

Expected outcome: a clear first Crop Storage concept — ready for team feedback and further development.
